- 
- 1 Can I have consistent inspection and policy enforcement among users anywhere and data anywhere? ☐
 - 2 Can I control how data is transferred, manipulated, or accessed via cloud and web-based services and applications? ☐
 - 3 Do I have visibility of all SaaS and IaaS, including shadow IT, in use by all users, anywhere in my environment? ☐
 - 4 How confident am I in the authenticity of the user? Am I sure there hasn't been any credential compromise? ☐
 - 5 Can I determine how my users are using data and via which apps and/or services? ☐
 - 6 Can I easily integrate incident response and forensics capabilities for SaaS- and web-based activity? ☐
 - 7 Can I determine the data's sensitivity both at rest and in transit? ☐
 - 8 Is my user experience performance-driven, frictionless, and transparent? ☐
 - 9 Do I understand the user experience from their device through inspection and to the destination? ☐
 - 10 Can I apply risk-based conditional access based on user behavior, data sensitivity, and application characteristics? ☐
 - 11 Do I understand and can I qualify the risk of SaaS and web-based applications being used in my environment? ☐
 - 12 Can I inspect and apply policy without "hair pinning" (i.e. routing back) to the data center, thus preserving my cloud service user experience? ☐
